GRAALL for Ph-negative ALL

How to manage Asp toxicity

Prevention of Venous Thrombotic Events in Adult Patients with ALL Treated in a Pediatric-Inspired Protocol -a GRAALL Study
Orvain C, et al. *Blood*. 2016;128:Abstract 2776

Methods; 8x native *E.coli* ASP IV (6.000 UI/m² / injection)
2x L-ASP IV (10.000 UI/m²/ injection)
prophylactic heparin was recommended

Results; 787 pts. with newly diagnosed Ph neg. ALL
14.4% (N=113) Venous Thrombotic Events (VTE)
64% (N= 72) Deep Vein Thromboses (DVT)
28% (N= 32) Cerebral Venous Thrombosis (CVT)
12% (N= 13) Pulmonary Embolism (PE)

Conclusion; appropriate AT prophylaxis associated with less VTE
25 pts. with VTE-after reexposure with *E.coli* ASP or Erwinase-ASP no recurrence of VTE

Fibrinogen concentrates may increase the risk of thrombosis and should be restricted to pts. with hemorrhage

GRAALL-2014 trial options

- Dose adaptations:
 - Reduce L-asparaginase and steroids doses in patients aged ≥ 45 years.
 - Higher MTX dose (5 g/m^2) in those aged < 45 years.
- CNS prophylaxis:
 - No CNS irradiation, with more triple ITs.
- L-asparaginase Tx monitoring:
 - L-aspa immunization and activity to guide switch from *E. Coli* asparaginase to erwiniase.
- Rapid centralized diagnosis of actionable Ph-like BCP-ALL cases.
- New agents front-line in high-risk patients:
 - **Blinatumomab** in BCP-ALL patients (QUEST Phase 2 study)
 - **Nelarabine** in T-ALL patients (ATRIALL Phase 2 study)
- Allogeneic SCT in first CR restricted to poor early MRD responders.
- Allow enrollment of patients aged 55y+ into innovative older ALL trials
 - EWALL-INO
 - EWALL-BOLD

Major Results and Future of Italian ALL study groups

GIMEMA LAL2116

*up to day +31

Patients will be subsequently enrolled in an ancillary study for follow-up

UKALL: moving forward

UKALL14

Aim 1B. (precursor-B ALL) MONOCLONAL ABS

Does the addition of rituximab to standard induction chemotherapy result in improved EFS in patients with precursor B-cell ALL?

Specific
Aims

Aim 1T (T ALL) NELARABINE

Does the addition of nelarabine improve outcome for patients with T cell ALL?

Aged
25-65

Aim 2. ASPARAGINASE

To determine the tolerability of pegylated asparaginase in induction and to compare anti-asparaginase antibody levels between patients in the rituximab randomisation groups from aim 1.

Aim 3. ROLE OF BMT IN HIGH RISK

To determine whether risk-adapted introduction of unrelated donor HSCT (myeloablative conditioning in patients <40 years old and non-myeloablative conditioning in patients >40 years old) improves EFS in patients at highest risk of relapse.

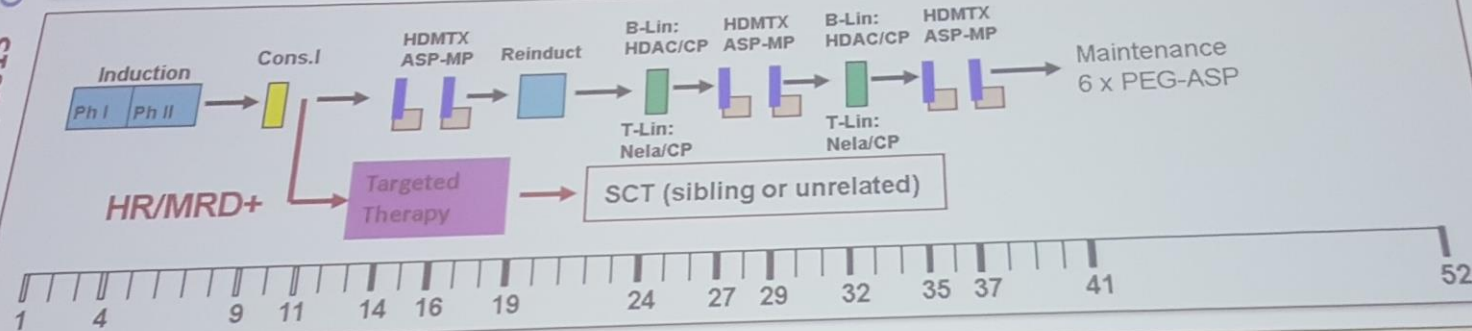

GMALL: moving forward

New Concept for Younger Patients GMALL Trial 08/2013

GMALL Trial 07/2003

GMALL Trial 08/2013

1. Experimental treatments in molecular failure
2. Reduction of SCT frequency in HR (randomisation); reduced conditioning >45 yrs
3. PEG-ASP / Rituximab intensification
4. Nelarabine in 1st line for T-ALL
5. Increased time- and dose intensity
6. Reduction of local therapies (randomisation of CNS irradiation)

Conclusions for EWALL scientific workshop

- Concordance on prognostic factors:
 - Age still counts !!
 - MRD is strongly predictive of outcome
 - Novel biologic factors
- Incorporation of novel drugs (e.g. blina, inotuzumab, nelarabine) all over Europe
- Guidelines for management of toxicity (mostly ASP) are taken into account

Topics

- European Working Group on ALL (EWALL) “Adult ALL first line therapy: Major results and future approaches of national ALL study groups”
 - GRAAL - Hervet Dombret
 - GIMEMA - Sabina Chiaretti
 - UKALL - Adele Fielding
 - GMALL - Nicola Goekbuget
- Novel treatments:
 - focus on CAR-T**
 - updates on blinatumomab and inotuzumab treatment

CAR T cells

Chimeric Antigen Receptor (CAR) T Cells

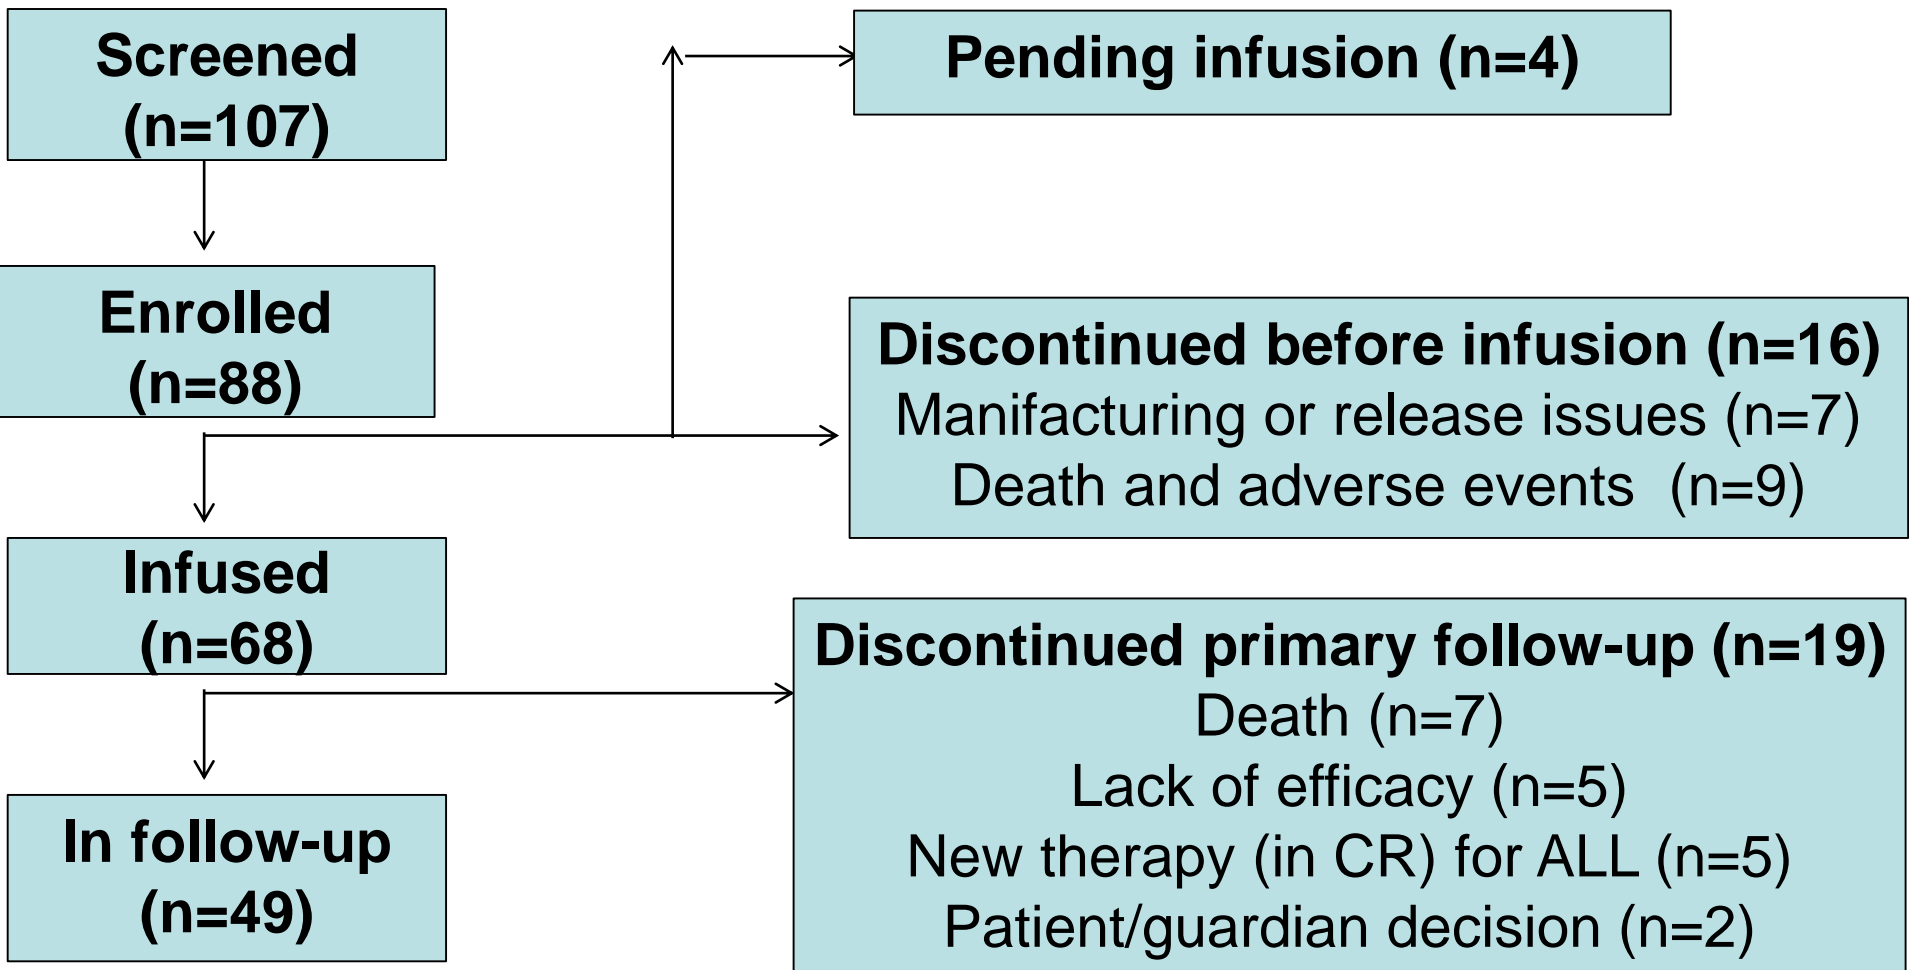

- Combine the scFv from a monoclonal antibody with an intracellular signalling domain¹
- Signalling domains differ, eg:
 - 41BB (CTL019 – CHOP/UPenn)
 - CD28 (KTE-C19 – NCI; 19-28z – MSKCC)
- Modified CAR-T cells
 - Redirect T-cell antigen specificity
 - Stimulate T-cell activation
 - Further enhance T-cell function via costimulation domains in the cytoplasmic tail^{1,2}

tellieri M, et al. *J Biomed Biotechnol.* 2010;2010:956304. 2. Davila ML, et al. *Sci Trans Med.* 2014;6(224):224ra25

FDA approved on August 31, 2017

Global registration trial of efficacy and safety of CTL019 in pediatric and young adult patients with relapsed/refractory (R/R) acute lymphoblastic leukemia (ALL): update to the interim analysis

Median time from infusion to cut-off: 8.8 months (range: 0.3-18.5)

Key patients characteristics

Baseline characteristics	Patients (n= 68)
Age, median (range), years	12(3-23)
Male sex, %	56
Prior SCT, %	59
Previous lines of therapy, median (range) %	3 (1-8)
Morphologic blast count in bone marrow, median (range), %	73 (5-99)
<i>Disease status, %</i>	
Refractory	21
Relapsed	79
High-risk genetic lesions, %	29
Down syndrome, %	9

Primary assessment of efficacy

Parameter	Efficacy analysis set (n=63) [¥]		
<i>Primary endpoint</i>	% (n/N)	95% CI	P value
Overall remission rate (CR+CRi)	83 (52/63)	(71-91)	<0.01
<i>Best overall response</i>			
CR	63		
CRi	19		
<i>Secondary endpoint</i>			
Best overall response of CR-Cri within 3 months with MRD-negative BM*	83	(71-91)	<0.001

[¥] Patients infused ≥ 3 months prior to data cut-off; MRD<0.01%

Overall safety

AE	%
Grade 3-4 AE, suspected to be drug related	85, 72
<i>Most common AE</i>	<i>Overall (G 3-4)</i>

G3 (n=14)	50	14
G4 (n=18)	67	33

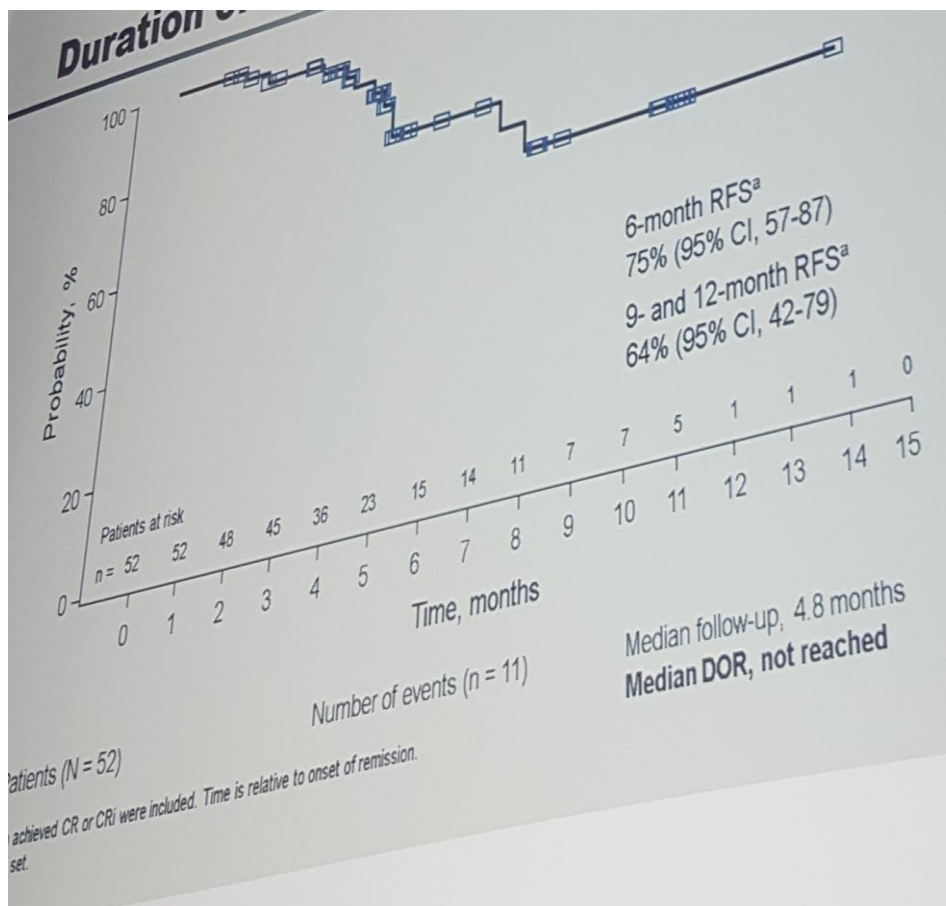

2 deaths within 30 days of infusion (1 cerebral hemorrhage)

No deaths for CRS or neurologic events

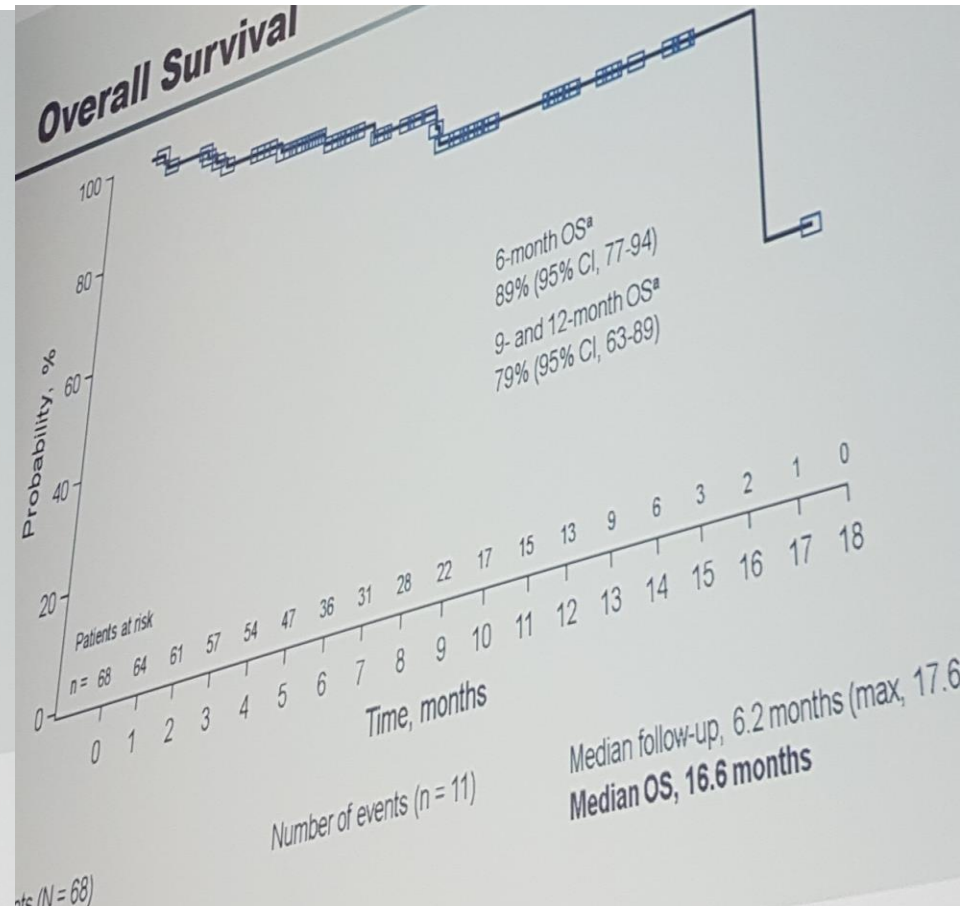

Neurologic events: encefalopathy (12%), confusional state (10%) and delirium (10%)

Association between CRS and neurologic events

RFS and OS

6 months RFS: 75%

6 months OS: 89%

CTL019 clinical pharmacology and biopharmaceutics in pediatric patients (pts) with relapsed or refractory (R/R) acute lymphoblastic leukemia (ALL)

Clinical Pharmacology of CTL019 in r/r pALL

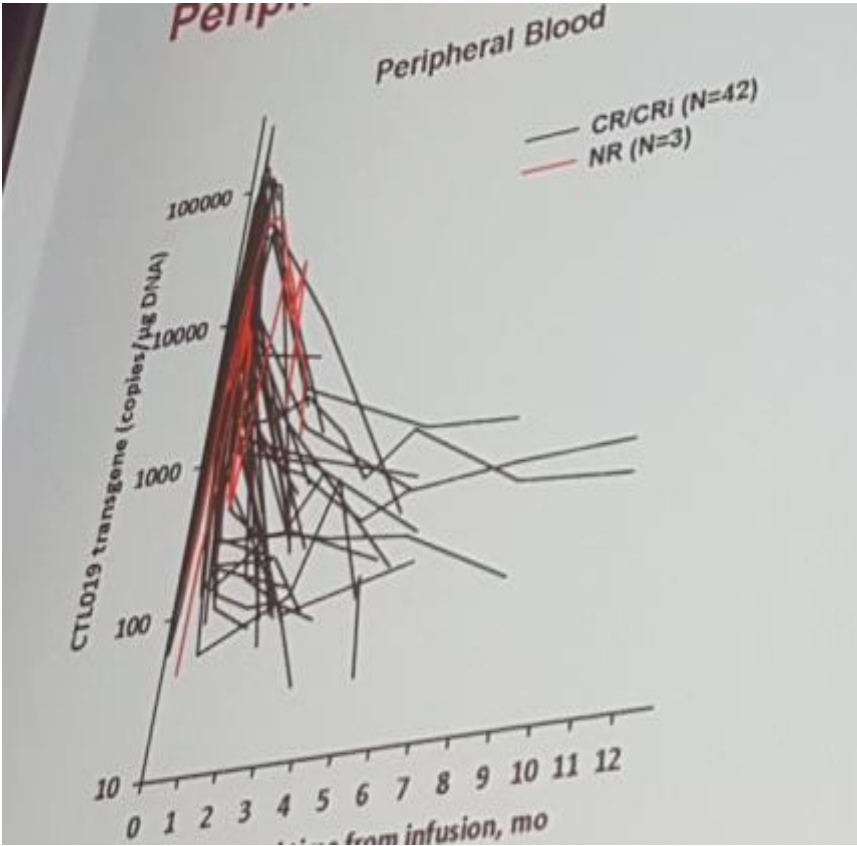

- Objectives
 - Investigate and characterize the relationship of patient characteristics and clinical outcomes (efficacy/safety)
 - CTL019 expansion, persistence
 - CTL019 dose
 - Tocilizumab impact on CTL019 cellular kinetics

Two pediatric and young adult r/r ALL studies pooled

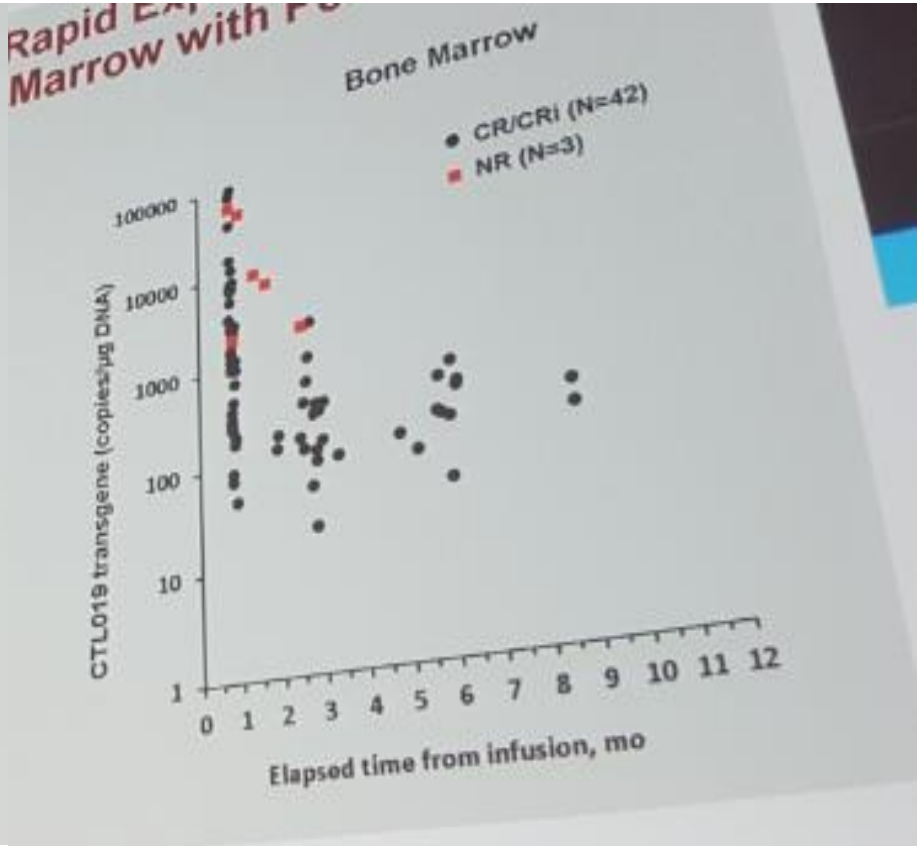

- ENSIGN (n=29) and ELIANA (n=50)
- Dose: Single infusion
 - >50 kg : 0.1×10^8 to 2.5×10^8 transduced viable T cells
 - ≤ 50 kg : 0.2×10^6 to 5.0×10^6 transduced viable T cells/kg

Responding pts have rapid expansion in peripheral blood and bone marrow and persistence

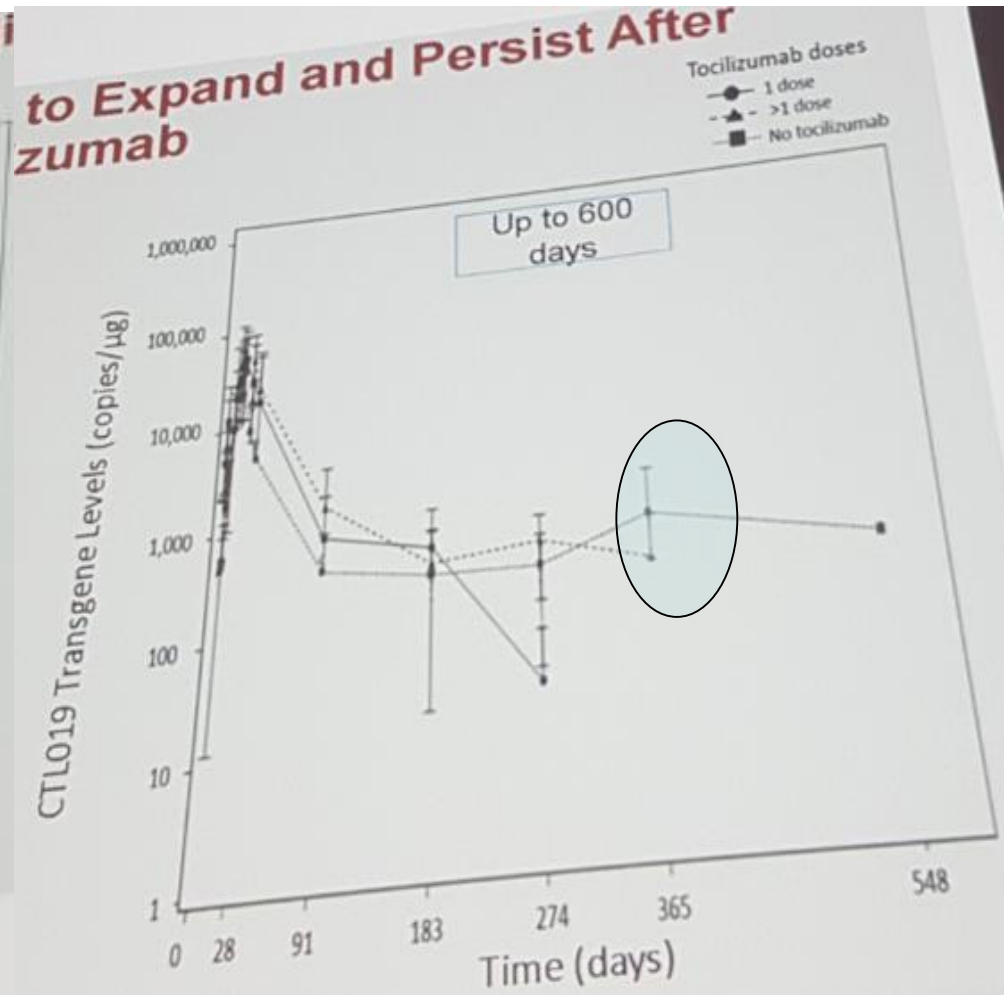

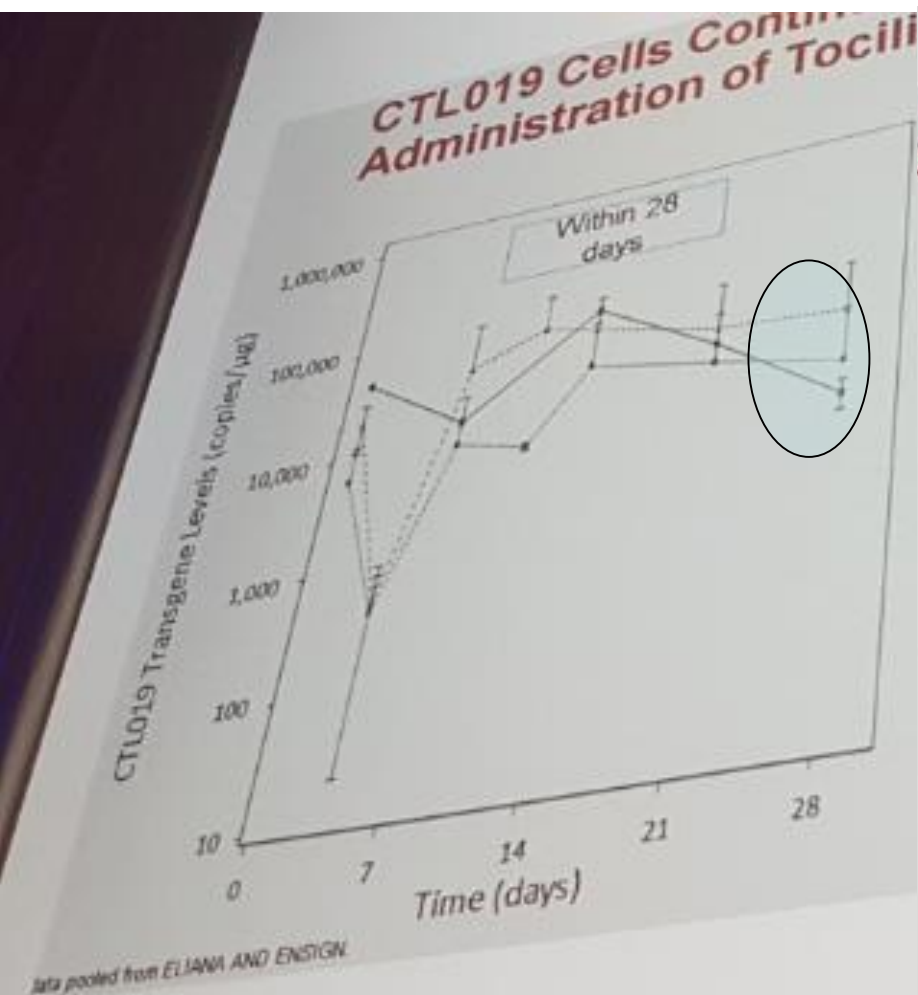

Peripheral blood

Bone marrow

Tocilizumab does not affect expansion

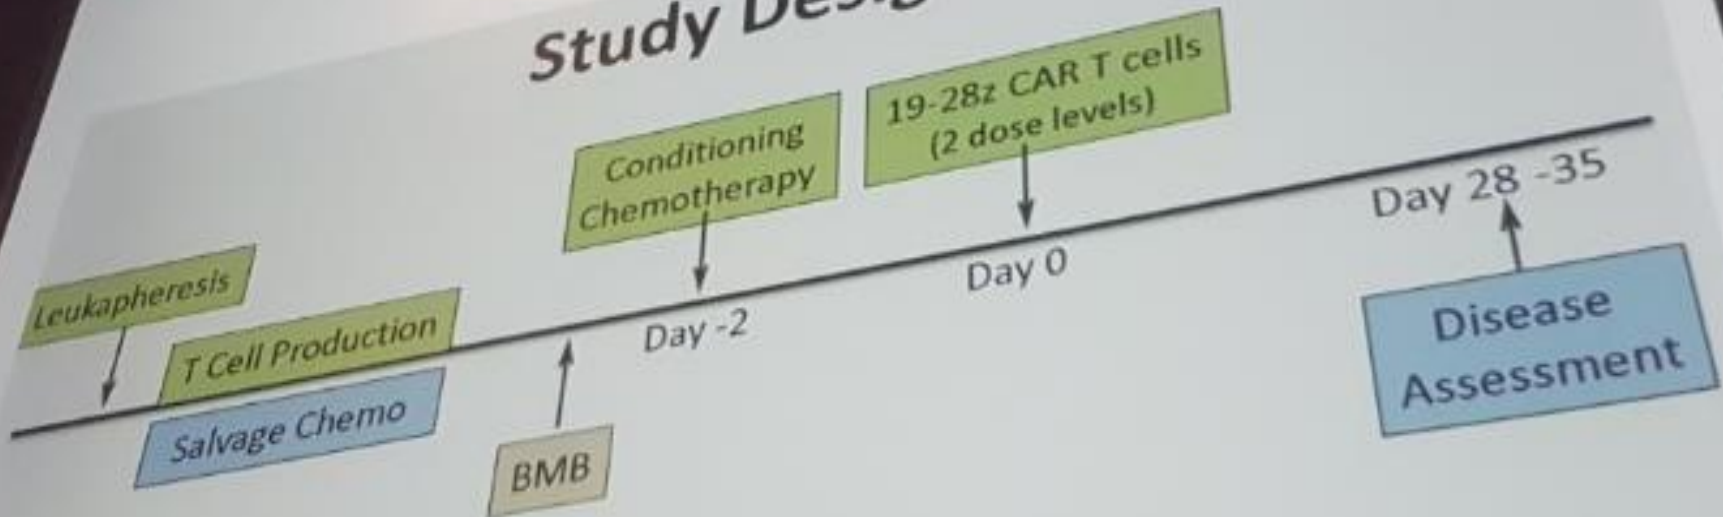

Mueller et al, abs#S477

Tocilizumab treatment can be safely administered, if required, and does not impact on short and long term CTL functionality

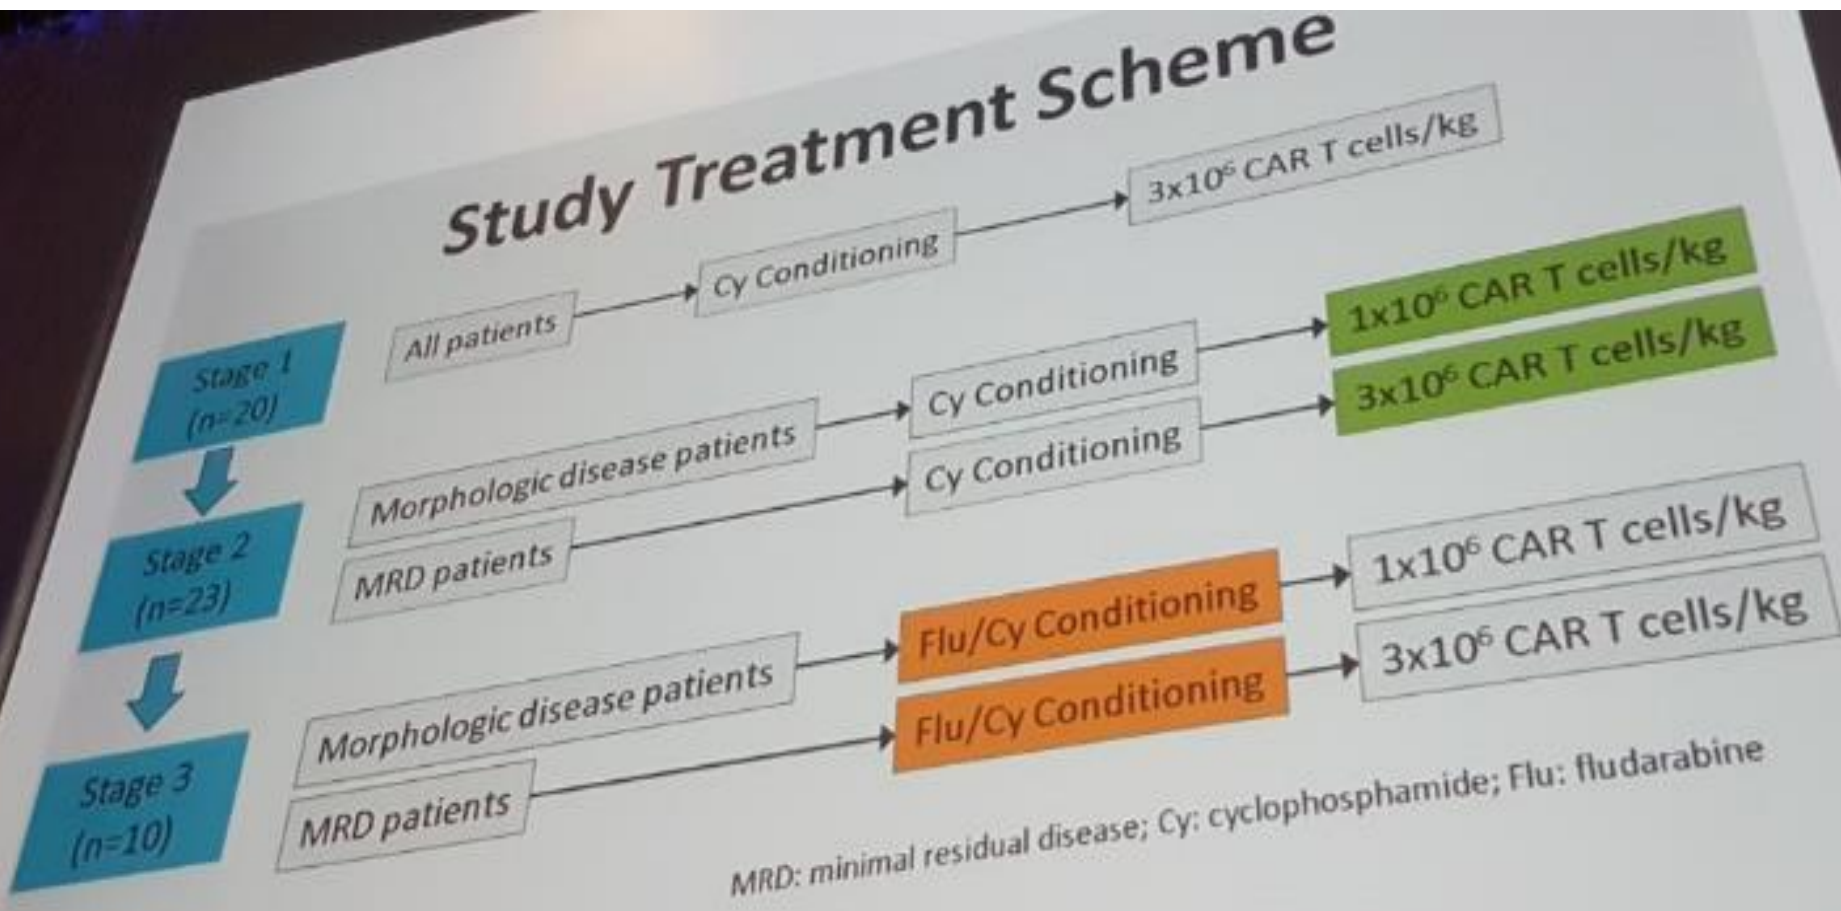

Durable long-term survival of adult patients with B-ALL after CD19 CAR(19-28z) T cell therapy

Study Design

- Median ALC = $0.8 \times 10^3/\text{ul}$ (range, 0.1 – 6.6)
- 97% success rate of protocol-specified CAR T cell production

Treatment scheme: 3 stages

Baseline characteristics

Characteristic	Patients (n=53)
Age, median (range)- yr	44 (23-74)
Salvage-treatment phase – no. (%)	
1	1 (2)
2	16 (30)
3	17 (32)
4	9 (17)
≥5	10 (19)
Primary refractory disease – no. (%)	
Yes	12 (23)
No	41 (77)
Prior allogeneic HSCT – no. (%)	
Yes	19 (36)
No	34 (64)
Bone marrow blasts, median % (range)	63 (5 - 97)
≥5%	27 (51)
<5%	21 (40)
<5% with extramedullary disease	5 (9)
Philadelphia chromosome (Ph)-positive – no. (%)	
Yes	16 (30)
No	37 (70)

CR rates

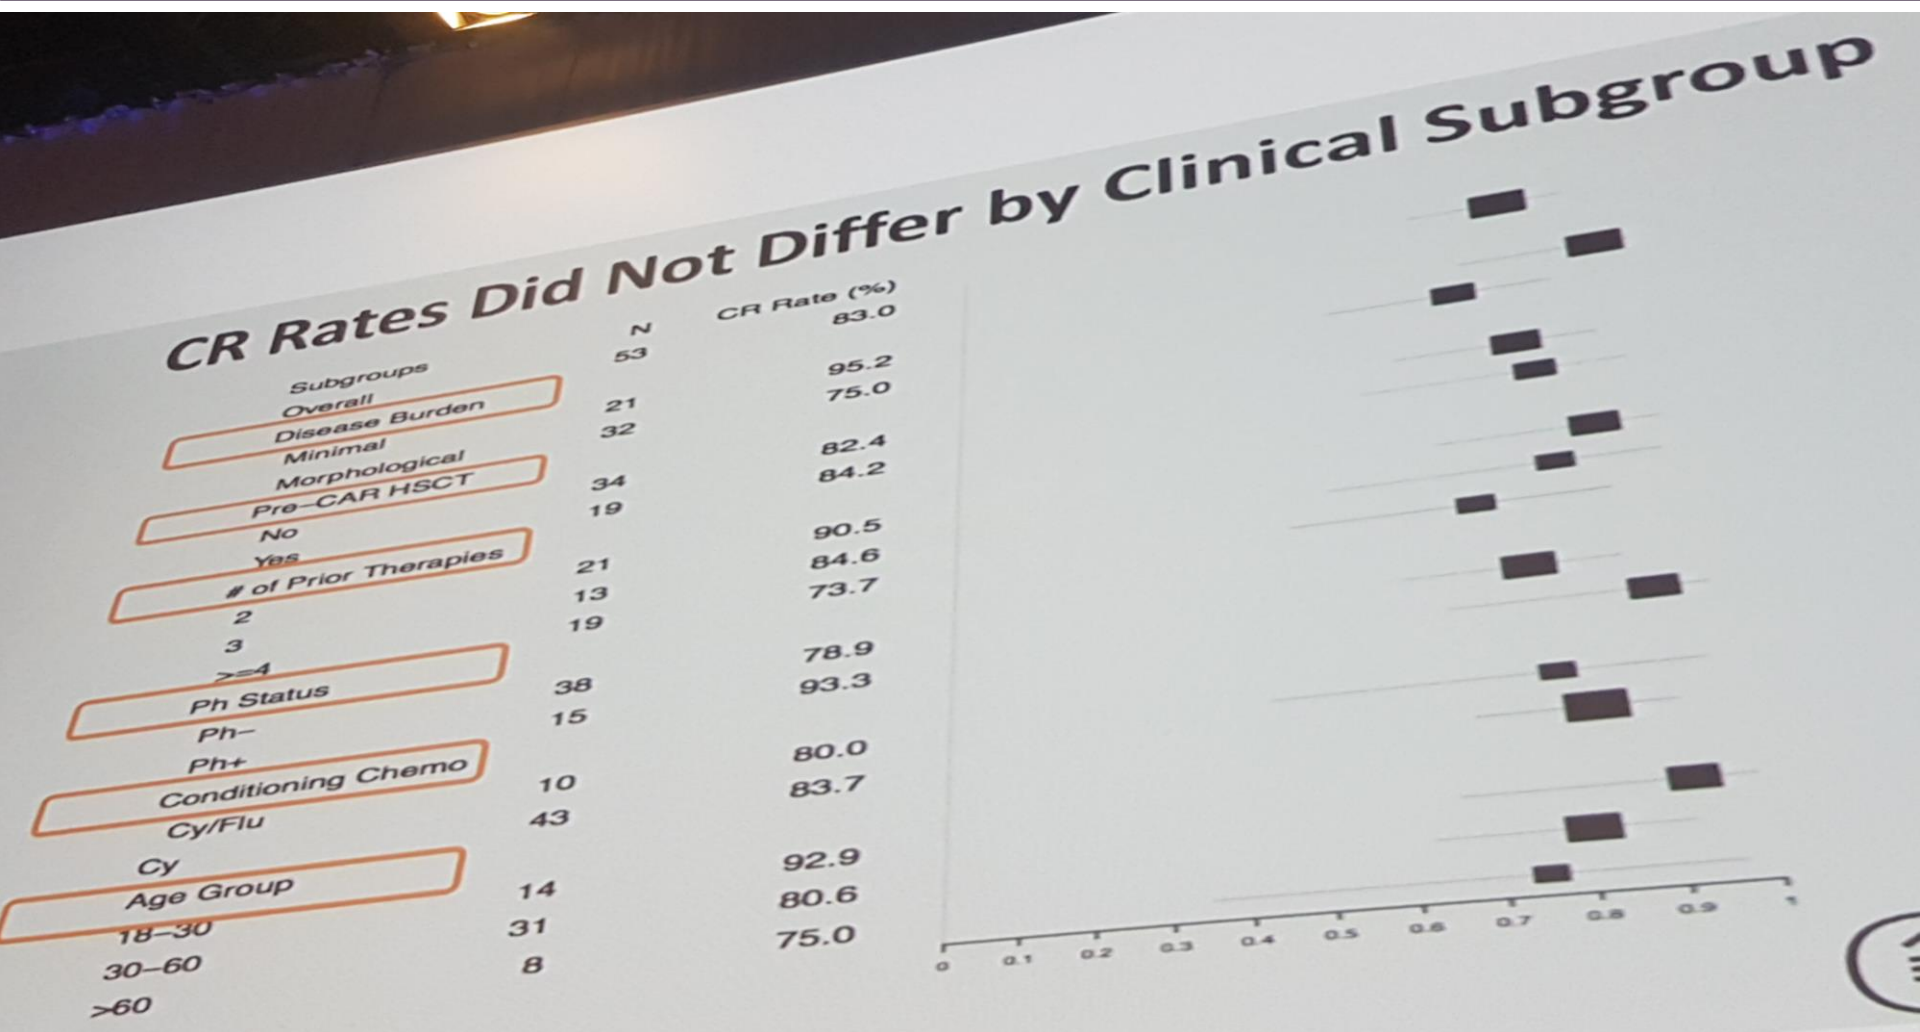

Study Outcome: Complete Remission (CR) Rates

- Overall CR rate: 84.6% (44 of 52 pts)
- MRD-CR rate: 66.6% (32 of 48 evaluable)

*MRD was assessed by multiparameter flow cytometry with a sensitivity of 10^{-4} .
† MRD assessment available in 48 pts with available BMA samples.

Response among subgroups

Better (p=ns) responses in MRD+ vs morphological, < lines of therapy, Ph+ and younger patients

CR correlates with CAR T expansion but not infused dose

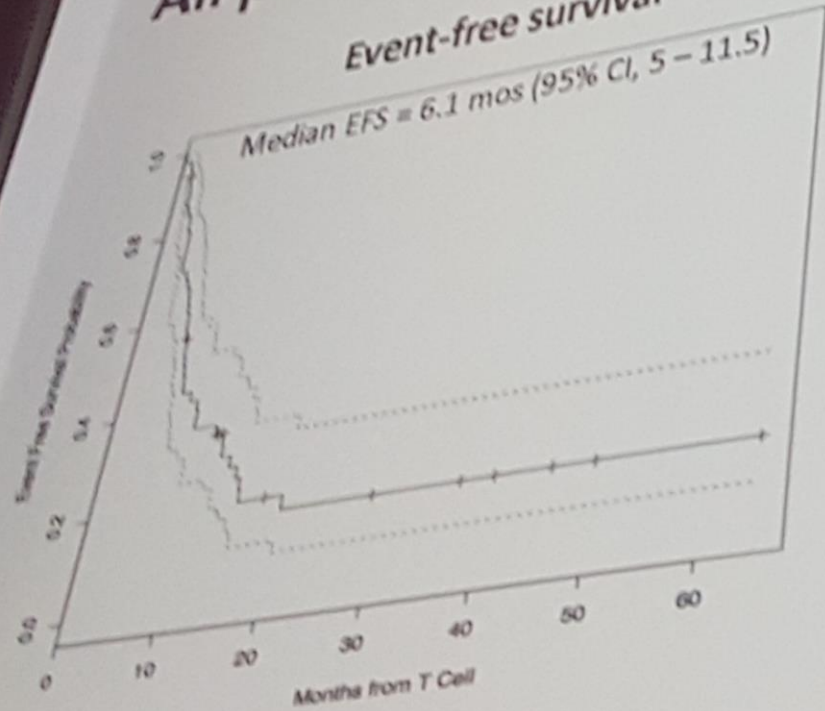

Overall long-term outcome

Long-Term Outcome: All patients

Median follow up = 29 months (range, 1 – 65)

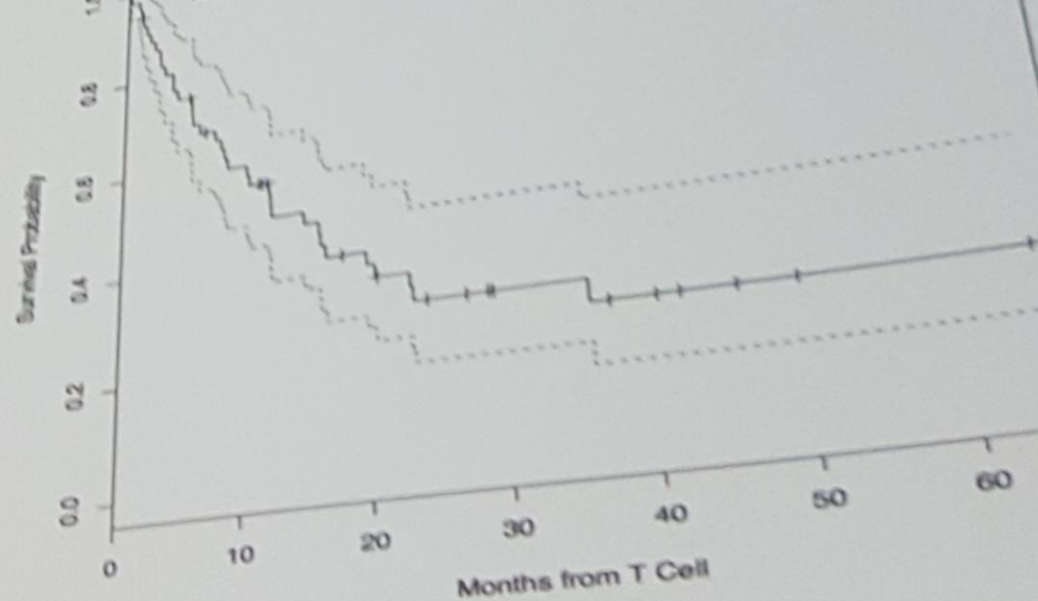

Event-free survival

Median EFS = 6.1 mos (95% CI, 5 – 11.5)

Overall survival

Median OS = 12.9 mos (95% CI, 8.7 – 23.4)

Long-term outcome by disease burden

Better outcomes in MRD+ vs morphological

Role of allo-SCT after CAR T (I)

n=17 allo-HSCT
Median time to allo-HSCT 74d (44-312)

Role of allo-SCT after CAR T (II)

No advantages in performing allo-SCT post CAR T.
Observation based on 17 patients

Adverse events

- Cytokine release syndrome (CRS):
 - Fever
 - Hypotension
 - Respiratory insufficiency
- Neurological changes: **NO Grade 5 NTX**
 - Delirium
 - Aphasia
 - Global encephalopathy
 - Seizure-like activities/seizure

Baseline and early post-treatment clinical and laboratory factors associated with severe neurotoxicity following 19-28z CAR T cells in adult patients with relapsed B-ALL

- **Aims**

To identify predictive parameters of neurotoxicity (NTX)

- **Population**

51 R/R patients treated with 19-28z CAR T

- **Results**

Clinical parameters:

-Correlation with disease burden ($\geq 50\%$ blasts) at the time of infusion

-Post-treatment \geq Gr3 CRS

-Fever

Blood parameters at day +3:

Low Plts ($< 60 \times 10^9/l$)

High ferritin levels

MCHC

Results

Cytokine profile at day +3:

GM-CSF

IFN

IL-2*

IL-5*

IL-10

IL-15

In vivo peak CAR T expansion at day +7

Specific of NTX

Multivariate analysis revealed that baseline Plts $< 60 \times 10^9/l$ or MCHC $> 33.2\%$ and morphologic disease ($> 5\%$ blasts) has 95% sensitivity and 70% specificity of identifying NTX patients.

Conclusions and perspectives

Conclusions

- 53 adult patients with R/R B-ALL treated at MSKCC
- High CR (77-95%) and MRD-CR rates are observed regardless of baseline disease burden
- Patients with minimal disease experience significantly higher and more durable survival with less sCRS/sNTX
- Durable responses and survivals are observed in a subset of patients with no subsequent alloHSCT in both dz cohorts
- Uncertain benefit of alloHSCT after 19-28z CAR T cells
- Early incorporation of 19-28z CAR T cells in the frontline MRD setting may maximize the therapeutic efficacy of 19-28z CAR T cells with reduced toxicity

Conclusions on CAR T therapy

- CAR T therapy appears promising in the R/R setting, both in children and adults.
- Management of patients is still an important concern, though we are learning!
- Allo-SCT post CAR-T????

Earlier use of blinatumomab is more effective also in the R/R setting

T-cell receptor β (TRB) repertoire characteristics in relapsed/refractory (R/R) B-cell precursor acute lymphoblastic leukemia (BCP-ALI) on blinatumomab treatment.

- Aims: To compare the differences in TRB repertoire diversity and composition between two groups of patients with r/r ALL

Blin responders have significantly higher TRB repertoire diversity at screening compared to persisters and the repertoire expansion during Blin treatment is sharper in responders.

Topics

- European Working Group on ALL (EWALL) “Adult ALL first line therapy: Major results and future approaches of national ALL study groups”
 - GRAAL - Hervet Dombret
 - GIMEMA - Sabina Chiaretti
 - UKALL - Adele Fielding
 - GMALL - Nicola Goekbuget
- Novel treatments:
 - focus on CAR-T
 - updates on blinatumomab and **inotuzumab** treatment

Inotuzumab ozogamicin in combination with low-intensity chemotherapy (mini-hyper-CVD) as frontline therapy for older patients with acute lymphoblastic leukemia: updated results from a phase I/II trial

Aims and methods

Update of previous findings in elderly.

Inotuzumab upfront + mini hyper-CVD (and rituximab).

Pts in CR after 8 cycles received POMP maintenance for 3 years.

Patients:

47, median age 68 yrs (range, 60-81), 4 already in CR at the time of enrollment.

Evaluable for response: 43.

Results

Response:

ORR: 42/43 (98%), CR: 36 (84%), CRp: 5 (12%), CRi: 1 (2%)

MRD- (6-colours FCM):

day +21: 31/41 (76%); week 12: 44/4 (96%)

Follow-up (median, range): 24, 1-55 months:

21 pts still on treatment, 3 underwent allo-SCT, 6 relapsed (13%), 16 died.

3-year CCR and OS: 72% and 54%.

Complications:

Grade ≥ 3 transaminase elevation: 9 pts (19%)

Hyperbilirubinemia: 8 pts (17%).

VOD: 4 pts (9%, 1 after ASCT).

Inotuzumab and allo-SCT (I)

Aim: to identify factors associated with outcomes after allo-SCT in prev treated R/R ALL pt with InO.

Background and population: Phase 3 INO-VATE trial; InO n=77; SOC n=31

Results:

- More InO pts achieved MRD^{neg} (71%) vs control group(26%)
- Less InO group received add therapy before HSCT(14% vs 55%)
- NRM rates were higher in InO group at 1yr (36% vs 20%) and at 2yrs (39% vs 31%) but relapse rate were lower both at 1yr (23% vs 29%) and 2yrs (33% vs 46%)
- No significant difference in post allo-SCT survival observed among groups.

VOD observed in 5 pts (all during the first 100 days after allo-SCT) InO and 0 in SOC group.

Conclusions:

- Compared with the SOC, InO permitted more pts with R/R ALL to proceed to allo-SCT in CR/Cri with MRDneg
- In order to reduce NRM and improve OS avoid dual alkylator conditionings regimens, especially those containing Thiotepa.

Inotuzumab and allo-SCT (II)

- **Aim:** to Investigate transplant outcomes for pts with or without InO exposure.
- **Method:** Nested control comparison of pts transplanted during the year in which they received InO.
- **Population:** 251 pts with B-ALL (median age 35yr; range 4-70) who received allo-SCT
- **Results:**
 - VOD: 21 pts (8%); median onset 19 days following allo-SCT;
 - Fatal VOD :in 5 overall pts (2%),

Factors contributing to VOD

- Prior exposure to InO (HR 3.05, 95% C.I. 1.3-7.2, p=0.01)
- Receiving a busulfan-based transplant preparative regimen (HR 3.4, 95% C.I. 1.02-12, p=0.05).

Protective factors to VOD

- Not receiving a prior SCT (HR 0.3, 95% C.I. 0.1-0.8, p=0.02).

Classification and regression tree analysis show that the combination of InO and a double alkylator preparative regimen was significantly associated with VOD (HR 5.9, 95% C.I. 1.9-18, p=0.002).

Burning questions

- In case of molecular relapse, what therapy is the best (considering that in the forthcoming future blinatumomab /ino will be incorporated in the front-line setting?)
- In case of hematologic relapse, what therapy is the best?
- Who is the ideal candidate for CAR T?
